Lab 1: Exploring Datasets

IRIS DATASET:

- Features in the Iris dataset:
 - 1. sepal length in cm
 - 2. sepal width in cm
 - 3. petal length in cm
 - 4. petal width in cm
- Target classes to predict:
 - 1. Iris Setosa
 - 2. Iris Versicolour
 - 3. Iris Virginica

```

Lab 2: FIND-S ALGORITHM FOR ENJOY SPORT:

Program 2 – Implement and demonstrate the FIND-S algorithm for finding the most specific hypothesis based on a given set of training data samples. Read the training data from a .CSV file Data set:Enjoysport

a. Enjoysport

Example	Sky	AirTemp	Humidity	Wind	Water	Forecast	EnjoySport
1	Sunny	Warm	Normal	Strong	Warm	Same	Yes
2	Sunny	Warm	High	Strong	Warm	Same	Yes
3	Rainy	Cold	High	Strong	Warm	Change	No
4	Sunny	Warm	High	Strong	Cool	Change	Yes

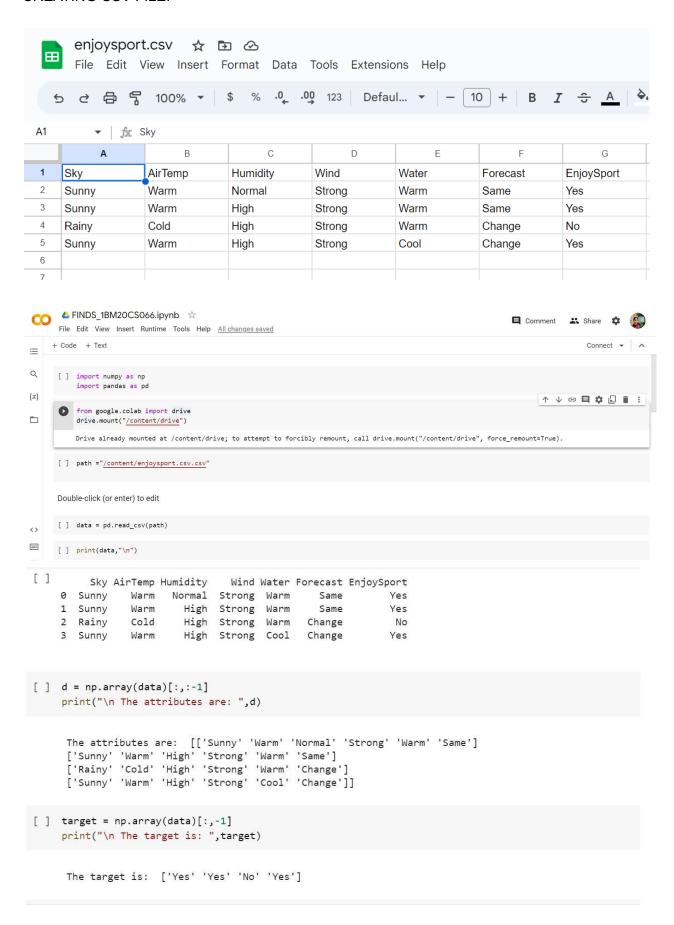

Algorithm:

initialize h to the most specific hypothesis in H h- $(\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset)$

- 1. First training example X1=< Sunny, Warm. Normal, Strong Warm Same>. EnjoySport=+ve Observing. The first trainin example, it is clear that hypothesis h is too specific. None of the "Ø" constraints in h are satisfied by this example, so each is replaced by the next more general constraint that fits the example h1 = < Sunny, Warm, Normal, Strong Warm, Same>.
- 2. Consider the second training example x2 < Sunny, Warm, High, Strong, Warm, Same>. EnjoySport+ve. The second training example forces the algorithm to further generalize h, this time substituting a "?" in place of any attribute value in h that is not satisfied by the new example. Now h2 =< Sunny, Warm, ?, Strong, Warm, Same>
- 3. Consider the third training example x3< Rainy, Cold, High, Strong, Warm. Change EnjoySport ve. The FIND-S algorithm simply ignores every negative example. So the hypothesis remain as before, so 13=< Sunny, Warm, ?, Strong, Warm, Same>
- 4. Consider the fourth training example x4 <Sunny, Warm, High. Strong. Cool, Change, EnjoySport +ve. The fourth example leads to a further generalization of h as h4=< Sunny, Warm, ?, Strong, ?, ?>
- 5. So the final hypothesis is < Sunny, Warm, ?, Strong, ?, ?>

For Sung, worn, ? , Grong, worn, som) 3 ed Hurston 19= < , wo attributer one taken be ontowns or paid lable 9x no or negotive. So h3=he (Retain Polevious hypotheris) h3=1'sunny', 'worm' ? , 'strong', worm' 'some) the Ombters 400 hu= ('sunny,'warm', 9, 'strong',? ,? > +ve FPnd S algorithm 1 Intalize 'h' to the most specific hope in H @ For Each positive training phytance (a) For Each attailable continent at Prih Pf the constraint as is satisfied by 'x' then do nothing Else Replace of en h by the next more general constraint that is Replaced by'x 3 output hypotheres h. 05/04/23 Proplement and demonstrate the FIND-S also for finding the most specific responses Bourd on a Given Set of

LAB 3: CANDIDATE- ELIMINATION- ENJOY SPORT

Program 3:For a given set of training data examples stored in a .CSV file, implement and demonstrate the Candidate-Elimination algorithm to output a description of the set of all hypotheses consistent with the training examples. Data set:Enjoysport

Example	Sky	AirTemp	Humidity	Wind	Water	Forecast	EnjoySport
1	Sunny	Warm	Normal	Strong	Warm	Same	Yes
2	Sunny	Warm	High	Strong	Warm	Same	Yes
3	Rainy	Cold	High	Strong	Warm	Change	No
4	Sunny	Warm	High	Strong	Cool	Change	Yes

ALGORITHM:

Step1: Load Data set

Step2: Initialize General Hypothesis and Specific Hypothesis.

Step3: For each training example

Step4: If example is positive example

if attribute_value == hypothesis_value:

Do nothing

else:

replace attribute value with '?' (Basically generalizing it)

Step5: If example is Negative example

Make generalize hypothesis more specific.

PROGRAM 5: Simple linear regression program

Dataset used:

	Α		В
1	x		у
2		1	1
3		2	2
4		3	1.3
5		4	3.75
6		5	2.25
7			

ALGORITHM:

- The main function to calculate values of coefficients
- Initialize the parameters.
- Predict the value of a dependent variable by giving an independent variable.
- Calculate the error in prediction for all data points.
- Calculate partial derivatives w.r.t a0 and a1.
- Calculate the cost for each number and add them.
- Update the values of a0 and a1.

```

Conclusion:

This model is not appropriate for this model. All the points of this dataset are away from the prediction line.

Program 6:Write a program to implement the naïve Bayesian classifier for a sample training data set stored as a .CSV file. Compute the accuracy of the classifier, considering few test data sets.

Data set used:

4	Α	В
1	outlook	play
2	rainy	Yes
3	sunny	Yes
4	overcast	Yes
5	overcast	Yes
6	sunny	No
7	rainy	Yes
8	sunny	Yes
9	overcast	Yes
10	rainy	No
11	sunny	No
12	sunny	Yes
13	rainy	No
14	overcast	Yes
15	overcast	Yes

Algorithm:

 $P(A \mid B) = \frac{P(B \mid A)P(A)}{P(B)}$

Formula for naive bayes classifier is as follows →

- 1. Convert the given dataset into frequency tables.
- 2. Generate Likelihood table by finding the probabilities of given features.
- 3. Now, use Bayes theorem to calculate the posterior probability.
- 4. Test accuracy of the result and visualizing the test set result.

output:

14/05/23 Naive Baye's theorem

Steps - by Step agarthm for Maine Bayes

1. Collect Data: collect the dataset that you want to use to train the model. The dataset

Should have labeled

- 2. process Data: preprocess the data to Pernove any noise, handle missing values and normalize the data (if necommany)
- 3. Split Data: Split
 formula $p(A|B) = \frac{p(B|A)p(A)}{p(A)}$

so to solve this problem, we need to follow the bellow steps:

- 1. convert the given destadet into frequency
- 2. Generate likelihood table by finding)
 the probabilities of given features.
- 3. Now, use Baye's theorem to caluctate the posterioon probability.

Program 7:K- means clustering

Algorithm:

Initialize k means with random values

For a given number of iterations:

Iterate through items:

Find the mean closest to the item by calculating the euclidean distance of the item with each of the means Assign item to mean

Update mean by shifting it to the average of the items in that cluster

Dataset:

8/0/23 3/6/23 **Program 9:** Apply EM algorithm to cluster a set of data stored in a .CSV file. Compare the results of k-Means algorithm and EM algorithm.

Algorithm for k means clustering:

- Initialize k means with random values
- For a given number of iterations:
- Iterate through items:
- Find the mean closest to the item by calculating the euclidean distance of the item with each of the means
- Assign item to mean
- Update mean by shifting it to the average of the items in that

clusters Algorithm for EM algorithm:

- The very first step is to initialize the parameter values. Further, the system is provided with incomplete observed data with the assumption that data is obtained from a specific model.
- This step is known as Expectation or E-Step, which is used to estimate or guess the values of the missing or incomplete data using the observed data. Further, E-step primarily updates the variables.
- This step is known as Maximization or M-step, where we use complete data obtained from the 2nd step to update the parameter values. Further, M-step primarily updates the hypothesis.
- The last step is to check if the values of latent variables are converging or

not. Dataset: Iris dataset

```
import matplotlib.pyplot as plt
from sklearn import datasets

Program 10:Implement the non-parametric Locally Weighted Regression algorithm in order to fit data points. Select the appropriate data set for your experiment and draw graphs.

Algorithm:

1. F is approximated near Xq using a linear function:

$$\hat{f}(x) = w_0 + \sum_{u=1}^k w_u K_u(d(x_u, x))$$

2. Minimize the squared error:

$$E_3(x_q) \equiv \frac{1}{2} \sum_{x \in k \text{ nearest nbrs of } x_q} (f(x) - \hat{f}(x))^2 K(d(x_q, x))$$

$$\Delta w_j = \eta \sum_{x \in k \text{ nearest nbrs of } x_q} K(d(x_q, x)) (f(x) - \hat{f}(x)) a_j(x)$$

It is weighted because the contribution of each training example is weighted by its distance from the query point.

Dataset: tip.csv

```
import matplotlib.pyplot as plt
import pandas as pd
import numpy as np
